

Bam-15

PEPTIDES

BAM-15 is a novel mitochondrial protonophore that works by uncoupling oxidative phosphorylation (the process by which cells produce ATP). Rather than storing energy as fat, BAM-15 increases energy expenditure by allowing mitochondria to burn excess fuel as heat. Unlike traditional

BAM-15 is a novel mitochondrial protonophore that works by uncoupling oxidative phosphorylation (the process by which cells produce ATP). Rather than storing energy as fat, BAM-15 increases energy expenditure by allowing mitochondria to burn excess fuel as heat. Unlike traditional stimulants and fat-burning compounds, it achieves this without increasing heart rate, blood pressure, or body temperature, offering a cleaner and more targeted metabolic effect. **BENEFITS** Enhances lipid metabolism and fat oxidation Regulates blood sugar Increases insulin sensitivity Increases resting energy expenditure Weight loss Senolytic/Anti-senescence (processes that inhibit, reverse, or clean senescent cells, which are aged cells that have stopped dividing and can contribute to aging and age-related diseases) effects Anti-inflammatory **DOSING** 2-4 week cycle followed by 2-4 weeks off Daily dosing (7 days/week) Dose in the morning Dosing while fasted preferable Take 1 pill (50mg) per day, daily, for the duration of the cycle
